Summary

I build backends for business processes with Java, Spring Boot and Camunda. For three years I have been developing the Service Desk portal of a large bank, used by every one of its employees. I take features from requirements to production, on the backend and the frontend.

Key skills

Interface: Vue 2, Vuex, Element UI, bpmn-js, JavaScript

API and logic: Java 21, Spring Boot 3, Spring Data JPA, Hibernate, MapStruct, OpenAPI, LDAP

Processes: Camunda 7, BPMN, Groovy, JUEL, timers, multi-instance, listeners

Integration: Kafka, REST, 1C, XML and XSD, JAXB

Data: PostgreSQL, Liquibase, Redis, ShedLock

Build and delivery: Docker, TeamCity, GitLab CI, Nexus, Maven, Gradle

Testing: JUnit, Mockito, Spring Boot Test

AI and LLM: Dify, Python, Prompt engineering, Claude Code

Reporting: JasperReports, Apache POI, DOCX

Work experience

Java Developer (full-stack), IT_One Nov 2023 – present

The bank's Service Desk: service catalog, requests with approval and fulfilment through BPM processes, incidents, reporting. A team of 20+ people, 5+ of them developers. 190+ tasks, 770+ commits, ~140 Liquibase migrations.

- I deliver features from requirements to production: Spring Boot on the backend, Vue 2 and Vuex on the frontend (dynamic form builder, admin console, incident pages).
- **A BPMN editor inside the portal.** I designed and built a process editor on bpmn-js and Camunda 7, from requirements to production, on the frontend and the backend. People view and edit diagrams in it and see how a request is progressing. Access depends on the role, and every diagram keeps its version and publication history.
- **Automatic retry of failed jobs.** I built the Camunda incident subsystem. Failed jobs go to a queue in the database, a ShedLock scheduler retries them by error pattern, and loop protection stops endless retries. Admins see the incident history and troubleshooting guides.
- **From a service description to a process in a couple of hours.** I built a Dify pipeline that reads a service description document and generates Camunda 7 BPMN. A static analyzer and an LLM audit check the diagram, and the output is a report for review. A second pipeline moves form field specifications from Confluence into the portal's XML forms.

- **Integrations and speed.** Notifications through Kafka and push. A courier service API: cost calculation, tracking and scheduled status updates. REST integrations with the Idea Platform low-code system. Redis caching and request search on native SQL with indexes. Build and delivery through TeamCity, GitLab CI and Nexus.

Java 21, Spring Boot 3.5, Camunda 7, PostgreSQL, Liquibase, Kafka, Redis, Docker, Vue 2, bpmn-js, Dify, Python

Software Engineer (Java Backend), Astelit Aug 2020 – Sep 2023

- Built Spring Boot backends for three projects across the full lifecycle: an electronic document management system, a Telegram bot and a retail mobile app.
- Took part in splitting a monolith into microservices: notifications, data sync with external systems, bots. Designed REST APIs between services and integrated with 1C.
- Set up CI/CD on my own: build and test pipelines for backend and frontend, artifacts in Nexus, Docker images, docker-compose and Portainer.
- Designed PostgreSQL schemas and optimized queries, ran Liquibase migrations, implemented LDAP authentication, wrote tests with JUnit and Mockito.

Java, Spring Boot, PostgreSQL, Liquibase, Redis, LDAP, Docker, Portainer, Nexus, JUnit, Mockito

Education

M.Sc. in Software Engineering, Web Technologies program, 2024. ITMO University, Saint Petersburg. Apostilled diploma.

B.Sc. in Informatics and Computer Engineering, 2021. Donetsk National University.

Languages

Russian: native. English: B2, Upper-Intermediate.

Work terms

Format: Remote, full-time

Contract: B2B, ready to register as a Georgian individual entrepreneur. EOR works too.

Location: Tbilisi, UTC+4. Russian citizen.
