SUMMARY

Java backend developer with 6+ years of commercial experience in enterprise systems (banking, document management, retail). Spent the last 3 years building the internal service management portal of a large bank, used by all of its ~30,000 employees: Java 21, Spring Boot 3, Camunda 7, PostgreSQL, Kafka, Redis. Own features end-to-end, from requirements to production, including frontend work in Vue.js. Took part in a monolith-to-microservices migration. Built an LLM pipeline (Dify) that cut BPM process design from 1–2 days to a couple of hours; use AI coding agents (Claude Code) daily. Experienced in remote work; UTC+4 overlaps well with Moscow and European teams. M.Sc. in Software Engineering, ITMO University.

KEY SKILLS

- **Backend:** Core Java (Java 8, Java 11, Java 17, Java 21), Spring Boot 3, Spring Security (LDAP authentication), Spring Data JPA, Hibernate, MapStruct, REST API (OpenAPI/Swagger)
- **BPM:** Camunda 7 (BPMN, Groovy, JUEL, timers, multi-instance, incident handling, listeners), bpmn-js
- **Databases:** PostgreSQL (relational data modeling, SQL, query optimization, indexing), Liquibase, Redis (NoSQL, caching)
- **Integration & Messaging:** Apache Kafka (producers, event-driven notifications), REST integrations with external systems (1C, courier services, push notifications), XML/XSD, JAXB
- **Architecture:** microservices, monolith decomposition, event-driven architecture (Kafka), design patterns (GoF), scheduled jobs and distributed locks (ShedLock)
- **DevOps & Build:** Docker, docker-compose, Portainer, CI/CD (TeamCity, GitLab CI), Nexus, Maven, Git
- **Testing:** unit and integration testing (JUnit, Mockito, Spring Boot Test)
- **AI / LLM:** Dify (workflows, Python code nodes), prompt engineering, LLM document extraction, LLM-based BPMN generation, LLM output evaluation (static analysis, LLM audit), AI coding agents (Claude Code)
- **Frontend:** Vue.js 3 and 2 (Vuex, Element UI), JavaScript
- **Reporting & Documents:** JasperReports, Apache POI (Excel), DOCX generation
- **Process:** Agile (Scrum), Jira, Confluence
- **Currently learning:** Kubernetes and Helm, AWS, Kotlin

WORK EXPERIENCE

Java Developer

IT_One | *Nov 2023 - Oct 2026*

Internal service management portal of a large bank, used by all ~30,000 bank employees (leave, payroll and other approvals go through it), 500–2,000 new requests per day: service catalog, requests with approval and fulfillment via BPM processes, incidents, reporting. Team of 20+ people, 5+ developers.

- Delivered features end-to-end, from requirements to production, on the backend (Spring Boot) and frontend (Vue 2, Vuex): dynamic form builder, admin console, incident pages, reports (JasperReports, Excel via Apache POI, DOCX generation).
- Designed and built an in-portal BPMN process editor (bpmn-js + Camunda 7) from requirements to production on both frontend and backend: diagram viewing and editing, execution path highlighting, role-based access, version and publication history.
- Built a Camunda incident management subsystem for failure recovery: automatic retry of failed jobs by error patterns with loop protection, DB-backed failed-job queue, ShedLock scheduler, incident history and troubleshooting guides for admins. ~25–30% of Camunda incidents were resolved automatically, without manual intervention.

- Automated process design with LLMs: a Dify pipeline generates Camunda 7 BPMN from a service description document, validates it with a static analyzer and an LLM audit, and produces a review report. Designing one process went from 1–2 days to ~10 minutes of generation plus a couple of hours of refinement. A second pipeline extracts form field specifications from Confluence into the portal's XML form definitions.
- Integrations and performance: Kafka producers for event-driven notifications, push notifications, a courier service API (cost calculation, tracking, scheduled status updates), REST integrations with the Idea Platform low-code system; Redis caching; sped up request search by 30% (native SQL, indexes).

Stack: Java 21, Java 11, Spring Boot 3.5, Camunda 7, PostgreSQL, Liquibase, Kafka, Redis, MapStruct, Docker, TeamCity, GitLab CI, Nexus, Vue 2, Vuex, bpmn-js, Dify, Python.

Software Engineer (Java Backend)

Astelit | *Aug 2020 - Sep 2023*

- Built Spring Boot backends for 3 projects across the full SDLC, from requirements analysis to testing: an electronic document management system, a Telegram bot and a backend for a retail mobile app.
- Contributed to decomposing a monolith into microservices (notifications, data synchronization with external systems, Telegram bots); designed REST APIs between services and integrated with 1C via REST API.
- Set up CI/CD independently: build and test pipelines for backend and frontend with artifact delivery to a local Nexus; containerized applications with Docker, configured docker-compose and managed containers via Portainer.
- Designed PostgreSQL schemas, optimized queries, managed migrations with Liquibase; used Redis for caching.
- Implemented user authentication with Spring Security and LDAP; wrote frontend code in Vue 3 as the team moved from Vue 2; covered code with automated tests (JUnit, Mockito).

Stack: Java 8, Java 11, Java 17, Spring Boot, Spring Security, PostgreSQL, Liquibase, Redis, LDAP, Docker, docker-compose, Portainer, Nexus, REST API, JUnit, Mockito, Vue 3.

EDUCATION

Master of Science (M.Sc.) in Software Engineering (Computer Science), Web Technologies program
ITMO University, Saint Petersburg · 2024 · apostilled diploma

Bachelor of Science (B.Sc.) in Informatics and Computer Engineering (Computer Science)
Donetsk National University · 2021

LANGUAGES

Russian — native · English — B2 (Upper-Intermediate)

ADDITIONAL INFORMATION

Citizenship: Russia. Based in Tbilisi, Georgia. Full-time remote (UTC+4); B2B contract (ready to register as a Georgian individual entrepreneur) or EOR.
